AI Analysis Summary

You've done a great job using semantic HTML and associating labels correctly! Your use of live regions for error messages and responsive images shows thoughtful accessibility. To take it further, consider managing focus and announcements when showing the success message to improve screen reader user experience.

Priority recommendations:

- 1 Add ARIA roles and focus management to the success message container to ensure it is announced and keyboard focus moves to it when displayed. For example, use `role="alertdialog"` or `role="region"` with `aria-live`, and programmatically set focus to the container or the dismiss button.
- 2 Ensure that when the success message appears, keyboard focus is trapped inside it until dismissed to prevent keyboard users from interacting with hidden content.
- 3 Consider adding `aria-hidden="true"` to the sign-up form container when the success message is shown to prevent screen readers from reading hidden content.

Issues 1

All (1) **Error (0)** **Warning (1)** **Info (0)**

WARNING **Navigation & Interaction** **AI Detected** 1 occurrence

The success message container with id 'success-msg' is hidden visually but lacks ARIA attributes to manage focus and announce its appearance. This causes screen reader users to miss important confirmation feedback, impacting their confidence and understanding of form submission success.

```
<div id="success-msg" class="success-msg hidden">
  
  <h2 class="heading heading-success">Thanks for subscribing!</h2>
  <p class="paragraph">
    A confirmation email has been sent to
    <span id="email-span" class="email-span"><span>. Please open it and
    click the button inside to confirm your subscription.
  </p>
  <button id="successBtn" class="btn btn-success">Dismiss message</button>
</div>
```

AI-detected issues notice

Some issues shown above were detected by AI analysis and may require human review for accuracy. If you're unsure about any findings or need clarification, please reach out in the help channel on Discord for assistance.

Strengths 5

Structure & Semantics

Uses a properly associated label with the email input via 'for' and 'id' attributes, ensuring screen readers announce the input purpose clearly.

Screen Reader Support

The error message span uses 'aria-live="polite"' to announce validation errors dynamically, helping users understand input issues in real time.

Navigation & Interaction

The form uses semantic HTML elements like `<form>`, `<label>`, `<input>`, and `<button>`, supporting keyboard navigation and assistive technology compatibility.

Media

Responsive images are implemented with `<picture>` and `<source>` elements, delivering appropriate images based on screen size without JavaScript.

Language

The document declares the language as English with `<html lang="en">`, helping screen readers select correct pronunciation and voice.
